

# Voice Control

- Uses the Python SpeechRecognition library
  - Defaults to Google Speech Recognition API
  - Backup is IBM Watson Speech to Text
- Thanks to multithreading, microphone is always active in the background
- Commands require the trigger “slide” to avoid accidentally changing slides
- Can go forward, back, or to a specific slide number
- Examples:
  - “Go back a slide”
  - “Go to the next slide”
  - “Go to slide number 4”
